

## About... Using Your (External Serial) TelePort on the New (Blue and White) Apple G3

### **Introduction:**

This document provides information about how to use your TelePort modem on the New Apple (blue and white) G3.

Because Apple's new (blue and white) G3 computers use USB technology and no longer ship with serial ports as previous Apple desktop computers did, external TelePort (serial) modems require a special converter or connector in order to be used on these computers.

We currently support the use of our modems on 2 such devices:

### **Keyspan USB to Serial Converter**

If you have any modem other than a TelePort V.90 (using GV software version 1.0.3, also known as GlobalFax 2.6.4), then your modem and GlobalFax naturally supports the use of the Keyspan converter provided you have installed Keyspan's software. If you have a TelePort V.90 modem using software 1.0.3 (2.6.4), your modem hardware is supported in it's current shipping state (again, provided you have installed Keyspan's software), but in order to allow GlobalFax to be used with the converter you will need to download an update to the TelePort control panel, which eliminates the "unimplemented trap" error message when trying to use GlobalFax. This update is available on our website at <http://www.globalvillage.com/support/teleport-56k-v90.html>. Once you've accessed the page, click on the **TelePort Control Panel Update...** link under **Software and Scripts**.

To use the Keyspan converter with your Global Village modem, we recommend the following:

1. Because Port 1 of the Keyspan converter emulates the Printer Port on your computer, you should connect your modem to Port 2 of the Keyspan converter.
2. In the TelePort control panel and/or any other modem software you're using, choose **Key USB0 P#2** as the appropriate port choice.

### **GeeThree Stealth Serial Port**

If you have any modem other than a TelePort V.90 (using GV software version 1.0.3, also known as GlobalFax 2.6.4), then your modem and GlobalFax naturally supports the use of the Stealth Serial Port provided you have installed Stealth's software. If you have a TelePort V.90 modem using software 1.0.3 (2.6.4), we believe your modem hardware and software should work in it's current shipping state (again, provided you have installed Stealth's software). However, should you have any problems using your modem/GlobalFax with the Stealth Serial Port you should download an update to your TelePort control panel. This update is available on our website at <http://www.globalvillage.com/support/teleport-56k-v90.html>. Once you've accessed the page, click on the **TelePort Control Panel Update...** link under **Software and Scripts**. If you don't have web access, the updater is also available on our Bulletin Board System (BBS) at (800) 335-6003 using the program ZTerm which came with your Global Village software. If you need assistance using ZTerm refer to the documentation that came with your modem or request document #2309, "How to... Download Files from Global BBS (using ZTerm)."

To use the Stealth Serial Port with your Global Village modem:

1. If you have not done so already, you will need to download and the required Stealth extension from GeeThree.Com from their website at <http://www.geethree.com/download.html>.
2. Connect your modem to the Stealth Serial Port.
3. In the TelePort control panel choose **Stealth Serial Port** or **Modem Port** as the appropriate port choice. In all other modem software, choose **Modem Port** as the port choice.
