

How to... Configure AOL 2.6/2.7 - all GV Modems

Introduction:

This document provides general information about how to configure AOL 2.6/2.7 with modem scripts that are provided with the GlobalFax software for your Global Village fax/modem. For detailed information about selecting modem scripts for America Online, refer to the documentation provided with America Online.

1. Copy the script whose name corresponds to your fax/modem (found in the America Online subfolder of the Scripts folder in the TelePort/PowerPort Accessories folder), to the Online Files folder in the America Online (application) folder.
2. Launch the America Online application. If this is the first time you are using America Online, you may need to personalize and set up the application.
3. When the Welcome to America Online screen appears, click the Setup button. The Connection Settings dialog box should appear. Specify the settings in the First Try section of the dialog box first.
4. Choose the script whose name corresponds to your fax/modem from the Modem Type pop-up menu.
5. Choose the appropriate port from the Port pop-up menu.
6. Click the Hardware Handshaking check box (for all modems except TP/PP Bronze. Bronze modem users should not select Hardware Handshaking).
7. Enter your access number and dialing options (if they are not already entered).
8. Repeat steps 5-7 for the Second Try section.
9. Click the Save button to save your configuration.
